

PROTEC III LSF (WITH ACRYLIC MEMBRANE) TECHNOLOGY

Protec III LSF with Acrylic membrane works on 3 levels, which give it the clear and distinct advantage for concrete floors.

1. Protec III LSF with Acrylic Membrane is easy to apply, because we use Liquid Silica Fume Technology and not silicates or siliconates, which are highly temperamental and difficult to work with. Protec III LSF with Acrylic Membrane is easily incorporated into the surface to increase the strength, hardness and micro-density of the concrete.
2. Protec III LSF with Acrylic Membrane incorporates a high-end acrylic component to give a proper cure, virtually eliminating warping and topical cracking. Other products do not have this full cure capability, and the slab will show the tell-tale damaging signs of topical shrinkage cracking and warping. Winter heating environments often produce dusting of the concrete, using Protec III LSF with Acrylic Membrane will protect the surface from exposure to achieve a proper cure and eliminate dusting.
3. Protec III LSF with Acrylic Membrane is less costly because the easy to use formulation eliminates the need for expensive and overpriced certified installers.
